## Introduction

This is the introduction to the notes.

## Example

### Introduction

The goal of this chapter is just to demonstrate how things should be organized. It will be removed from the notes in the end.

## Markdown Basics

### Resources and Helpers

A nice cheat sheet about Markdown can be found at this link: <https://www.markdownguide.org/cheat-sheet/>.

On VS Code, there are some nice extensions that can help you write Markdown files:

- Markdown All in One to provide useful shortcuts and commands
- markdownlint to properly format your Markdown files

Feel free to ask me if you have questions about Markdown.

## Comments

This `<!--This is a comment.-->` is  
`<!--`  
*Comments are not rendered.*  
*They can take multiple lines*  
`-->`  
a  
sentence.

This is a sentence.

## Headers

```
<!-- Comment the fist headers to avoid messing up the outline of this file -->
<!--
# Level 1

## Blockquotes

> This is a blockquote.

This is a blockquote.

## Code

*Inline code:* ``print("Hello, World!")``

Code block:

```
```python
def hello_world():
    print("Hello, World!")
```
```

Inline code: `print("Hello, World!")`

Code block:

```
def hello_world():
    print("Hello, World!")
```

## Tables

*Table: A simple table*

| Header 1 | Header 2 |
|----------|----------|
| Cell 1   | Cell 2   |
| Cell 3   | Cell 4   |

Table 1: A simple table

| Header 1 | Header 2 |
|----------|----------|
| Cell 1   | Cell 2   |
| Cell 3   | Cell 4   |

## Math

*Inline math:*  $x^2$  is the square of  $x$ .

Block math:

$$\int_0^{\infty} e^{-x^2} dx = \frac{\sqrt{\pi}}{2}$$

Inline math:  $x^2$  is the square of  $x$ .

Block math:

$$\int_0^{\infty} e^{-x^2} dx = \frac{\sqrt{\pi}}{2}$$

# How does GNSS work?

## Introduction

GPS (Global Positioning System), also known as NAVSTAR (NAVigation Satellite Time And Ranging) had its first satellite launched in 1978.

## GPS segments

The GPS system consists of *three segments*:

1. **Space segment** (satellites with atomic clocks)
2. **Control segment** (ground stations for clock offsets)
3. **User segment** (receivers)

## Radio Signal

The GPS radio signal contains:

- the **L-band carrier frequency** between 1 and 2 GHz
- the **Pseudo Random Noise** (PRN, also called the **spreading code**), unique to each satellite, publicly available
- the **navigation message** containing the satellite orbit and clock information

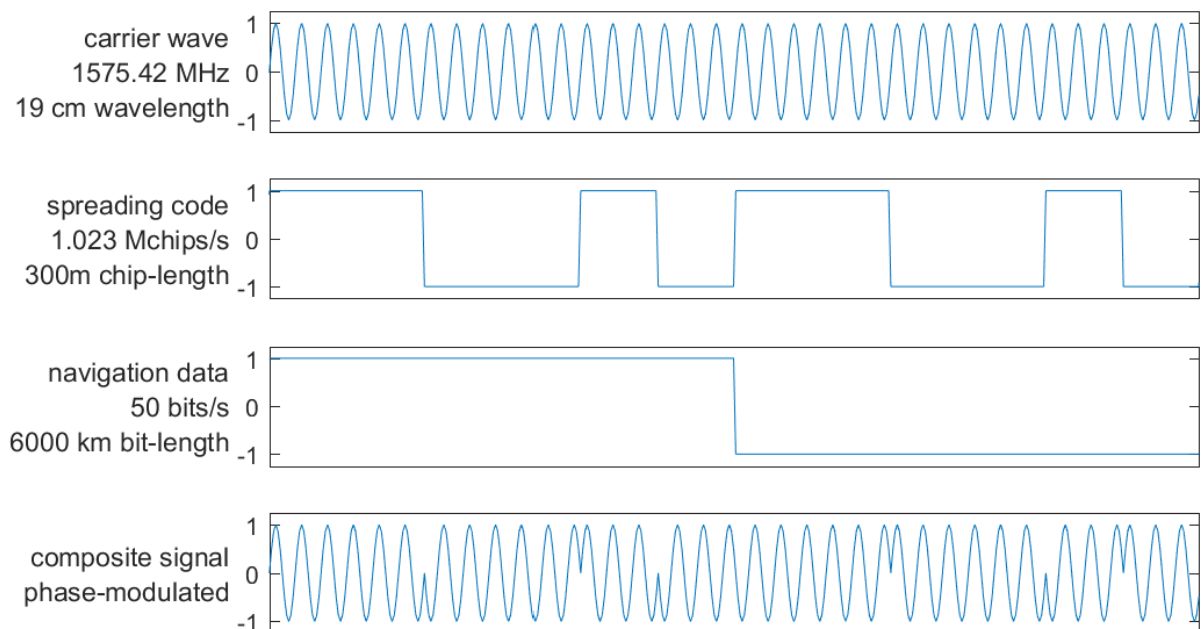

Figure 2: GPS L1 CA-signal (scale is not accurate)

## Initialisation

When starting, GPS receivers try to find a particular GPS satellite on *each of their channels* (tens to hundreds). This is done by **overlaying the received signal** with a replica of the **spreading code** and then shifting it until correlation shows a maximum (best fit, or match).

## Pseudorange Measurement

The **pseudorange**  $p_{r,s}$  is calculated by multiplying the travel time  $\tau_{r,s}$  by the speed of light  $c$ :

$$p_{r,s} = c \cdot \tau_{r,s} \text{ where } \tau_{r,s} = t_r - t_s$$

## Carrier Phase Measurement

Carrier Phase Measurement:

- Measures **fractional phase difference** between the received *carrier wave* from the satellite and a locally generated *replica*.
- Provides a **very precise distance** measure (satellite to receiver)
- Needs to be **initialized** by finding the initial number of carrier wave cycles.
- Is much more precise than pseudorange code measurement. thanks to the **carrier period** being **much smaller** than code chip duration (in L1 CA-code signal, *1540 carrier periods* fit in one PRN spreading code chip).

## Jamming and Spoofing

### GPS Jamming

### GPS Spoofing

## GNSS performance

### Introduction

### Error Sources

### Pseudorange Calculation

Multiple issues affect the calculation of the pseudorange:

- **satellite clock offset** (known).
- **receiver clock offset** (unknown).
- **ionosphere delay** (unknown).
- other errors, such as *multipath* (unknown).

The calculation is very sensible since  $c \approx 3 \times 10^8$  m/s, and a **1  $\mu$ s** error will cause a **300 m** error in the calculated distance.

## Ionosphere Delay

Ionospheric delay:

- Is due to **free electrons** in the ionosphere.
- Is highly variable (depends on **time** and **space**).
- Ranges from *a few meters to hundreds of meters*.
- Is maximum near geomagnetic equator, around local noon and during solar maxima.
- Is proportional to  $1/\text{frequency}^2$ .
- Can be estimated using two frequencies. This is why satellites emit at **L1** (1575.42 MHz) and **L2** (1227.60 MHz).

## Accuracy and Precision

The quality of the measurement can be assessed through the carrier-to-noise-density ratio  $C/N_0$  (signal strength).

The precision of the measurement depends on the method used:

Table 2: Precision of GNSS measurements

|           | Pseudorange                  | Carrier Phase                 |
|-----------|------------------------------|-------------------------------|
| Precision | Few meters to few decimeters | Few centimeters to millimeter |

## Dilution of Precision

## Availability, Continuity and Integrity

### Availability

### Continuity

### Integrity

## PPP-RTK

### Abbreviations

- **SV**: space vehicles or orbiting space vehicles
- **RTK**: Real-Time Kinematic
- **PPP**: Precise Point Positioning
- **PPP-RTK**: Hybrid of PPP and RTK
- **CORS**: Continuously Operating Reference Station
- **NRTK**: Network RTK
- **OSR**: Observation State Representation
- **SSR**: State Space Representation

## PPP

- **PPP** achieves decimetre-level or better accuracy by leveraging corrections transmitted via satellite or the internet.
- It utilises the **SSR** message format for efficient data transmission.
- **PPP** is suitable for global applications due to its independence from regional base stations.
- The primary limitation of **PPP** is its long convergence time, typically ranging from 5 to 30 minutes.
- **PPP** primarily corrects for orbit errors, clock errors, and biases to achieve its positioning solution.
- **PPP** offers a trade-off between accuracy and coverage, providing moderate accuracy over a wide area.
- Variations like PPP-AR and A-PPP exist, offering enhanced accuracy or specialized capabilities.

## RTK

- **RTK** provides centimetre-level accuracy, achieving the highest precision among the discussed technologies.
- **RTK** relies on the **OSR** message format, which requires a two-way communication channel between the base station and the rover.
- The coverage area of **RTK** is limited to a short range (30-50 km) due to signal degradation with distance.
- **RTK** boasts a near-instantaneous convergence time, typically under 5 seconds.
- **RTK** corrects for various errors, including orbit errors, clock errors, bias, ionospheric delay, and tropospheric delay.
- **RTK** is widely adopted in applications demanding high accuracy within a limited area, such as surveying and agriculture.
- Developments like Network RTK (NRTK) address range limitations by incorporating networks of base stations.

## PPP-RTK

- **PPP-RTK** combines the strengths of PPP and RTK, offering high accuracy, global coverage, and fast convergence.
- **PPP-RTK** achieves centimetre-level accuracy comparable to RTK while offering global coverage.
- **PPP-RTK** employs the efficient **SSR** message format, enabling broadcast corrections and lower bandwidth requirements.
- **PPP-RTK** utilises a network of CORS stations for precise atmospheric and clock corrections.
- **PPP-RTK** converges significantly faster than PPP, typically within 1-10 minutes, and potentially seconds under ideal conditions.
- It effectively corrects for orbit errors, clock errors, bias, ionospheric delay, and tropospheric delay, allowing for integer ambiguity resolution.
- **PPP-RTK** gracefully degrades to standard PPP performance when outside the range of the CORS network.

## Comparing RTK, PPP, and PPP-RTK

| Feature                     | RTK                                                                            | PPP                                                        | PPP-RTK                                                                                                                                      |
|-----------------------------|--------------------------------------------------------------------------------|------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Accuracy</b>             | <b>cm-level</b> (up to 1 cm + 1 ppm)                                           | <b>dm-level or better</b> (less than 10 cm)                | <b>cm-level</b> , similar to RTK                                                                                                             |
| <b>Coverage Area</b>        | <b>Limited range</b> (typically 30-50 km from the base station)                | <b>Global</b>                                              | <b>Global</b> with graceful degradation to standard PPP outside the range of the CORS network                                                |
| <b>Message Format</b>       | <b>OSR</b> (Observation Space Representation)                                  | <b>SSR</b> (State Space Representation)                    | <b>SSR</b> (State Space Representation)                                                                                                      |
| <b>Transmission Channel</b> | <b>Isionway communication</b> between base station and rover                   | Corrections delivered via <b>satellite or the internet</b> | Corrections <b>broadcast to users</b> , enabling a large number of users to connect simultaneously                                           |
| <b>Convergence Time</b>     | <b>Near-instantaneous</b> (typically less than 5 seconds)                      | <b>Relatively long</b> (typically 5-30 minutes)            | <b>Fast</b> (typically 1-10 minutes, potentially within seconds under ideal conditions)                                                      |
| <b>Errors Solved</b>        | Orbit errors, clock errors, bias, <b>ionospheric delay, tropospheric delay</b> | Orbit errors, clock errors, bias                           | Orbit errors, clock errors, bias, <b>ionospheric delay, tropospheric delay</b> , enabling <b>integer ambiguity resolution</b>                |
| <b>Key Strengths</b>        | High accuracy, very fast convergence time                                      | Global coverage, no reliance on local base stations        | High accuracy, fast convergence time, global coverage, lower bandwidth requirements compared to RTK, graceful degradation outside CORS range |
| <b>Key Limitations</b>      | Limited range, high bandwidth requirements, reliance on local base stations    | Long convergence time, lower accuracy compared to RTK      | Still requires a CORS network (though less dense than RTK) and may degrade to standard PPP with increasing distance from CORS station        |
